## Azure SQL Database and Enterprise Edition

<https://docs.microsoft.com/en-us/sql/relational-databases/performance/intelligent-query-processing?view=sql-server-ver15>

# Batch mode adaptive joins

- Automatic switching between hash join and nested loop
- Based on row count
- Requires a columnstore index
- Introduced in 2017
- Enterprise Edition only

# Interleaved execution

- Captures cardinality of multi-statement table valued functions instead of 100
- Adjusts plan based on actual cardinality
- Introduced in 2019

# Table variable deferred compilation

- Bases estimation of row count on actual count of table variable instead of 1
- Plan adjusts based on actual row count
- Introduced in 2019

# Scalar UDF inlining

- Code in UDFs refactored into a relational expression
- Doesn't work for all UDFs
- Introduced in 2019

# Batch mode on rowstore

- Calculate aggregates in batches instead of row-by-row for large results
- Decreases CPU requirements
- Introduced in 2019
- Requires Enterprise Edition

# Memory grant feedback

- Recalculates actual memory required for a query
- Updates cached plan
- Decreases spills to disk
- Introduced in 2017 (batch mode) and 2019 (row mode)
- Requires Enterprise Edition

# Approximate count distinct

- Use when speed is more important than accuracy
- Up to a 2% error rate
- Saves memory and less likely to spill to disk
- Introduced in 2019

# What's new in 2022?

- Parameter sensitive plan optimization
- Multiple plans against the same query
- See a demo: <https://rd.gt/3oCrVs2>

# Options

- Database compatibility level controls availability of all functionality
- Database property to disable individual features
- Disable at query level with a hint
